

Web 2.0

Lecture 5: Data Structures – Atom and AtomPub

doc. Ing. Tomáš Vitvar, Ph.D.

tomas@vitvar.com • @TomasVitvar • <http://vitvar.com>

Czech Technical University in Prague
Faculty of Information Technologies • Software and Web Engineering • <http://vitvar.com/courses/w20>

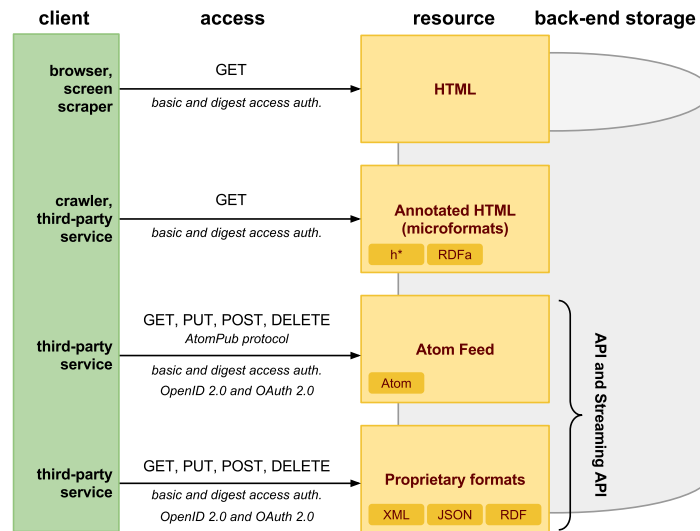

Výzkumný ústav fyzikální metrologie
Praha & Bř. (rozšiřujeme do veškerých oblastí)

Modified: Fri Mar 17 2017, 12:53:36
Humla v0.3

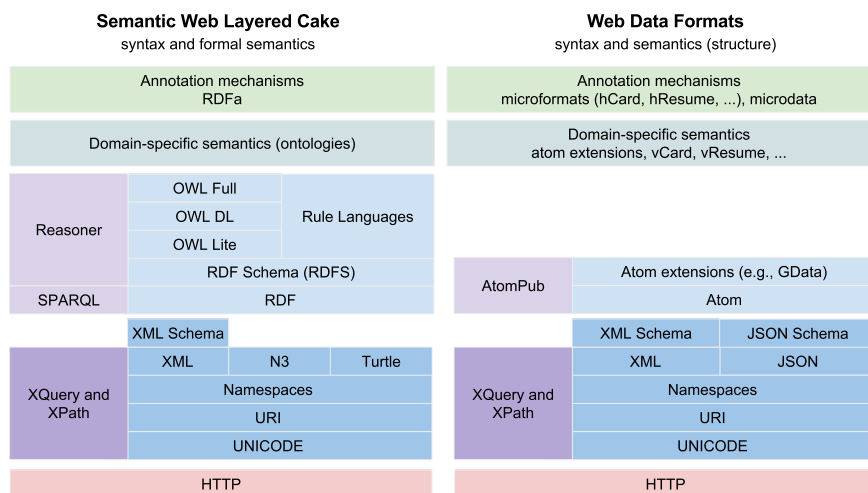

Overview

- Overview of Formats and Protocols
- Atom Syndication Format
- AtomPub Protocol

Data on the Web

Data Syntax, Structure and Semantics

Atom Standard

- Need for a standard syndication format
 - *machine-processable Web site content*
 - *Alternative to RSS*
 - *RSS spec does not say how to encode content, strings only ASCII-encoded, not clearly defined meaning of RSS elements, etc.*
 - *See RSS Flaws* [↗](#)
- IETF Atom Publishing Format and Protocol WG
 - *RFC 4287: Atom Syndication Format* [↗](#)
 - *RFC 5023: Atom Publishing Protocol* [↗](#)
- Adoption
 - *Google: Google Data Protocol (GData)*
 - *Microsoft: Open Data Protocol (OData)*

Overview

- Overview of Formats and Protocols
- **Atom Syndication Format**
- AtomPub Protocol

Atom Syndication Format

Atom Feed Document

atom:feed element
(author, title, id, updated, ...)

atom:entry* element

Atom Entry Document

atom:entry element

- Two types of atom documents

- Atom Feed Document

- represents an atom feed, its metadata and some or all entries associated with it.

- Atom Entry Document

- represents exactly one entry, outside of context of atom feed

Atom Syndication Format

- Atom Feed Document Example

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <feed xmlns="http://www.w3.org/2005/Atom">
3
4   <title>Example Feed</title>
5   <link href="http://example.org/" />
6   <updated>2003-12-13T18:30:02Z</updated>
7   <author>
8     <name>John Doe</name>
9   </author>
10  <id>urn:uuid:60a76c80-d399-11d9-b93C-0003939e0af6</id>
11
12  <entry>
13    <title>Example feed title</title>
14    <link href="http://example.org/2003/12/13/atom03" />
15    <id>urn:uuid:1225c695-cfb8-4ebb-aaaa-80da344efa6a</id>
16    <updated>2003-12-13T18:30:02Z</updated>
17    <summary>Some text</summary>
18  </entry>
19 </feed>
```

Atom Elements – Atom Feed

- Specification
 - defined as XML information set, serialized as XML 1.0
 - must be well-formed, no DTD/Schema → no requirements to be valid.
- **atom:feed** element
 - (***): zero or more occurrences – repeating fields
 - (*?*): zero or one occurrence – non-repeating fields
 - (*)*: exactly one occurrence – non-repeating fields

```
1  atomFeed =
2      element atom:feed {
3          atomCommonAttributes,
4          (atomAuthor*
5            & atomCategory*
6            & atomContributor*
7            & atomGenerator?
8            & atomIcon?
9            & atomId
10           & atomLink*
11           & atomLogo?
12           & atomRights?
13           & atomSubtitle?
14           & atomTitle
15           & atomUpdated
16           & extensionElement*),
17      atomEntry*
18  }
```

Atom Elements – Atom Entry

- **atom:entry** element
 - (***): zero or more occurrences – repeating fields
 - (*?*): zero or one occurrence – non-repeating fields
 - (*)*: exactly one occurrence – non-repeating fields

```
1  atomEntry =
2      element atom:entry {
3          atomCommonAttributes,
4          (atomAuthor*
5            & atomCategory*
6            & atomContent?
7            & atomContributor*
8            & atomId
9            & atomLink*
10           & atomPublished?
11           & atomRights?
12           & atomSource?
13           & atomSummary?
14           & atomTitle
15           & atomUpdated
16           & extensionElement*)
17  }
```

Pointers to other information

- URI identifier

- *unique identification of thing*
 - *feed/entry id*
 - **author** and **contributor** (*person uri*)
 - **generator** (*uri*)
 - **category** *schema (uri), term (uri)*
- example:*

```
1 | <category scheme="http://example.org/dogs"
2 |   term="http://example.org/dogs#basset"
3 |   label="Basset"/>
```

- Unambiguous identification of things using URIs

- *Helps interoperability, can take advantage of wikipedia concepts*
- *still not very common, will improve with linked data*

Atom Links

- Links to other Atom documents
 - *Atom defines simple link structure*
 - **type** *defines content type*
 - **rel** *defines relation to this resource*
 - *self, alternate, related, enclosure, via*
 - *standardized by IANA*
- Adoption by RESTful services
 - *Core for HATEOAS*
 - *Adopted in Link header, see Web Linking* [🔗](#)
 - *More details in Lecture 4 – HATEOAS.*

Encoding Textual Content

- Plain text

```
1 | <title type="text">
2 | Less: &lt;
3 | </text>
```

– *simple text, must not contain child elements*

- HTML

```
1 | <title type="html">
2 | Less: &lt;em> &amp;lt; &lt;/em>
3 | </text>
```

– *html text, must not contain child elements*

– *any markup must be escaped,*

– *should be possible to display it as HTML inside <div> element*

- XHTML

```
1 | <title type="xhtml" xmlns:x="http://www.w3.org/1999/xhtml">
2 | <x:div>Less: <x:em> &amp;lt; </x:em></x:div>
3 | </text>
```

Aggregation

– *Atom feed may include entries from another atom feed*

→ *these entries do not originally belong to this feed*

– **source** element should contain at least:

→ *required atom feed's metadata **id**, **title** and **updated***

– *retains information about an entry's source feed*

Data and Time

- Notion of time
 - Atom document is a snapshot of resource in some time
 - **updated** (feed, entry) – last update of the resource
 - **published** (entry) – initial creation of the first availability of the resource
- Data format
 - Examples:

```
1 | <updated>2003-12-13</updated>
2 | <updated>2003-12-13T18:30:02.25Z</updated>
3 | <updated>2003-12-13T18:30:02.25+01:00</updated>
```

T – time delimiter
Z – identifies UTC time (~GMT)
(+|-)hh:mm – defines local time and a shift in hours and minutes from UTC

Polling

- **updated** is the last updated time of the resource at the server
- resource refresh interval is pre-defined by the service

Extensions

- Possible to combine various vocabularies
 - through namespaces **xmlns** attribute, extensions of **link.rel** attribute
- Example: GData (PicasaWeb, Docs, ...)
 - combines vocabularies such as Geo location

```
1 <?xml version='1.0' encoding='UTF-8'?>
2 <feed xmlns='http://www.w3.org/2005/Atom' xmlns:gml='http://www.opengis.net/gml'
3   xmlns:gphoto='http://schemas.google.com/photos/2007'
4   xmlns:georss='http://www.georss.org/georss'>
5   <id>http://picasaweb.google.com/.../albumid/5262593967320034641</id>
6   <updated>2010-02-25T20:47:53.295Z</updated>
7   <category
8     scheme='http://schemas.google.com/g/2005#kind'
9     term='http://schemas.google.com/photos/2007#album' />
10  <title type='text'>Památkově chráněný dům v Loukově</title>
11  <link rel='http://schemas.google.com/g/2005#feed' type='application/atom+xml'
12    href='http://picasaweb.google.com/.../albumid/5262593967320034641?hl=en_US' />
13  <link rel='http://schemas.google.com/photos/2007#slideshow'
14    type='application/x-shockwave-flash'
15    href='https://picasaweb.google.com/s/c/bin/slideshow.swf?...'/>
16  <georss:where>
17    <gml:Point>
18      <gml:pos>50.5576865 15.0356436</gml:pos>
19    </gml:Point>
20    </georss:where>
21  <gphoto:allowPrints>true</gphoto:allowPrints>
22  ...
23 </feed>
```

Overview

- Overview of Formats and Protocols
- Atom Syndication Format
- **AtomPub Protocol**
 - *Extensions*

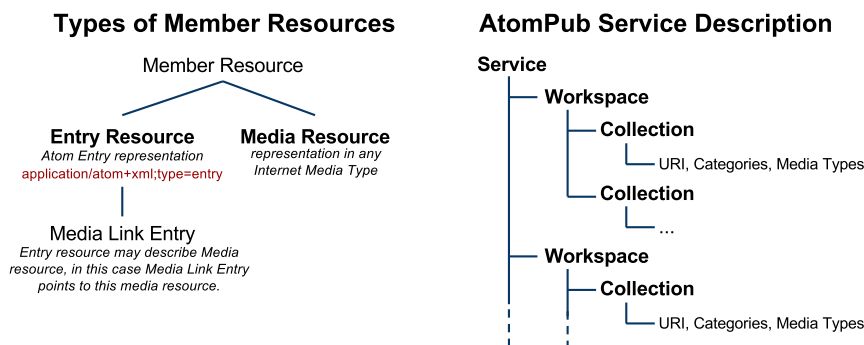

AtomPub Protocol

- Standard protocol for manipulation of resources
 - Defines a service description by following constructs
 - **service** – a set of workspaces
 - **workspace** – a set of collections
 - **collection** – a set of resources
 - Defines protocol for editing, that is: creating (POST), updating (PUT), reading (GET), deleting (DELETE)
- Relation to Atom Syndication Format
 - Atom Feed and Atom Entry as resource representations
- Basis for many, such as:
 - Google Data Protocol (GData)
 - Microsoft Open Protocol (OData)

Lecture 5: Data Structures – Atom and AtomPub, CTU Summer Semester 2016/2017, @TomasVitvar

– 19 –

AtomPub Elements

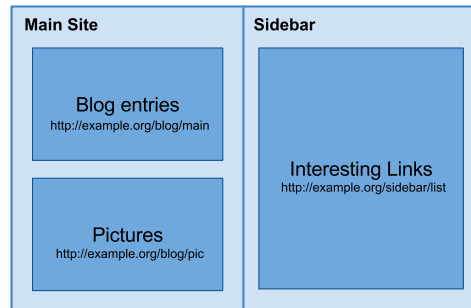

- Collection properties and definition of constraints
 - **URI** – id of the collection (Atom Feed)
 - **categories** – list of allowed categories in the collection
 - **accept** – list of Internet media types allowed in the collection
 - **URI points to an Atom Feed resource!**

Lecture 5: Data Structures – Atom and AtomPub, CTU Summer Semester 2016/2017, @TomasVitvar

– 20 –

Example Blogging Site Description

Conceptual structure of a blogging site

- Workspaces
 - *Main Site, Sidebar*
- Collections
 - *Blog entries, pictures, interesting links*

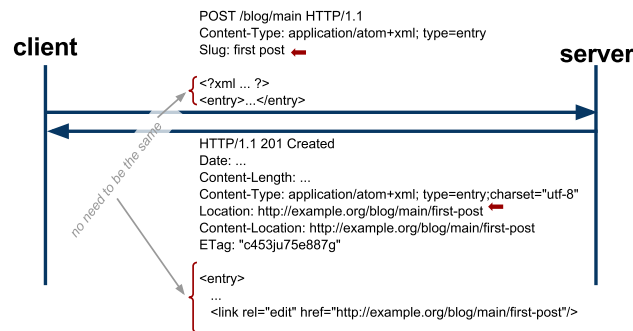

Example Blogging Site Description

```
1 <?xml version='1.0' encoding='UTF-8'?>
2 <service xmlns="http://www.w3.org/2007/app"
3   xmlns:atom="http://www.w3.org/2005/Atom">
4   <workspace>
5     <atom:title>Main Site</atom:title>
6     <collection href="http://example.org/blog/main">
7       <atom:title>Blog Entries</atom:title>
8       <categories
9         href="http://example.com/cats" />
10      </collection>
11     <collection href="http://example.org/blog/pic" >
12       <atom:title>Pictures</atom:title>
13       <accept>image/png</accept>
14       <accept>image/gif</accept>
15     </collection>
16   </workspace>
17   <workspace>
18     <atom:title>Sidebar</atom:title>
19     <collection href="http://example.org/blog/sidebar" >
20       <atom:title>Interesting Links</atom:title>
21       <accept>application/atom+xml;type=entry</accept>
22       <categories fixed="yes">
23         <atom:category
24           scheme="http://example.org/cats"
25           term="http://example.org/cats#joke" />
26         <atom:category
27           scheme="http://example.org/cats"
28           term="http://example.org/cats#serious" />
29       </categories>
30     </collection>
31   </workspace>
32 </service>
```

Protocol Operations

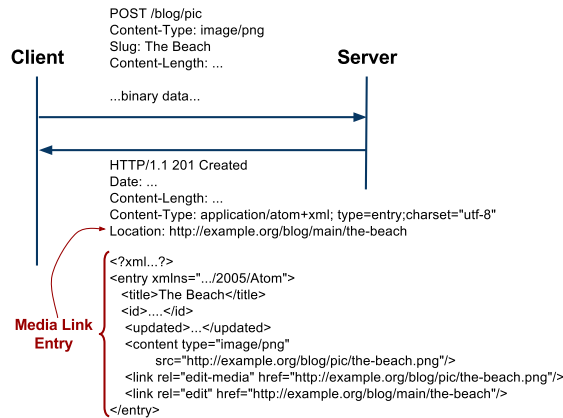

- Operations to manipulate resources
 - Retrieving a service document (is obvious, *GET*)
 - Listing collection members (filtering and projections)
 - Creating a resource (entry and media)
 - Editing a resource (is obvious, *PUT* and *DELETE*)
- AtomPub **does not define**:
 - Any manipulation with
 - service documents, workspaces and collections
 - How service documents are discovered
- AtomPub may be used w/o service descriptions
 - They're good for discovering constraints on the service

Creating Entry Resource

- Server checks constraints of the collection
- Server may modify member representation
 - such as changes **id**, adds **updated** element
- if **Content-Location** is not equal to **Location** the request and response representation are not the same!
- **ETag** should be used for
 - conditional *GET* and *PUT* (see [lecture 4 – scalability](#))

Creating Media Resource

- Server checks the constraints of the collection
 - may return **415 Unsupported Media Type** if not accepted
- Media Link Entry is an Entry resource that describes metadata about media resource (such as a picture)

Listing Collection

- Must provide representation in Atom Feed
- Contains list of Atom **Entry** elements
 - must have **link** with attribute **edit**
 - must have **edited**, order of entries by this date
 - is not the same as **Last-Modified** header
- Entries in collection are not full representations
 - clients should retrieve them using **GET** on entry **URI**
- To limit amount of entries
 - links with semantics for navigation through the whole list

```
1 <feed xmlns="http://www.w3.org/2005/Atom">
2   <link rel="first" href="http://example.org/blog/main/" />
3   <link rel="previous" href="http://example.org/blog/main/3" />
4   <link rel="self" href="http://example.org/blog/main/4" />
5   <link rel="next" href="http://example.org/blog/main/5" />
6   <link rel="last" href="http://example.org/blog/main/10" />
```

Overview

- Overview of Formats and Protocols
- Atom Syndication Format
- AtomPub Protocol
 - *Extensions*

Extensions

- OpenSearch
 - *Specification: OpenSearch* [🔗](#)
 - *Search service description and search results*
- Google Data Protocol
 - *Filtering, partial response and partial update*
 - *Entity tag attribute for **<feed>** and **<entry>** elements*
 - *HTTP methods overriding*

OpenSearch

- Open Search Specification
 - **Open Search Description Document (OSDD)**
 - *description of a search service*
 - **OpenSearch Response Document**
 - *Standard description of search results by search services*
 - *extension of syndication formats, RSS and Atom*
- Adoption
 - *Browsers such as IE, Google Chrome – search engines you can use to search various sites.*
 - *APIs such as Bing API, Google Docs, etc. – description of search results.*

OpenSearch Description Document

- Example:

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <OpenSearchDescription xmlns="http://a9.com/-/spec/opensearch/1.1/">
3   <ShortName>Web Search</ShortName>
4   <Description>Use Example.com to search the Web.</Description>
5   <Tags>example web</Tags>
6   <Contact>admin@example.com</Contact>
7   <Url type="application/atom+xml"
8     template="http://example.com/?q={searchTerms}&pw={startPage?}&form
9   <Url type="application/rss+xml"
10    template="http://example.com/?q={searchTerms}&pw={startPage?}&form
11  <Url type="text/html"
12    template="http://example.com/?q={searchTerms}&pw={startPage?}"/>
13  <Image height="64" width="64" type="image/png">
14    http://example.com/websearch.png
15  </Image>
16  <Query role="example" searchTerms="cat" />
17  <Developer>Example.com Development Team</Developer>
18  <AdultContent>false</AdultContent>
19  <Language>en-us</Language>
20  <OutputEncoding>UTF-8</OutputEncoding>
21  <InputEncoding>UTF-8</InputEncoding>
22 </OpenSearchDescription>
```

- **searchTerms** *is a free text*

OpenSearch Response Document

- Example:

- Result in Atom format of a search query

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <feed xmlns="http://www.w3.org/2005/Atom"
3   xmlns:opensearch="http://a9.com/-/spec/opensearch/1.1/">
4   <title>Example.com Search: New York history
5   <updated>2003-12-13T18:30:02Z</updated>
6   <author>
7     <name>Example.com, Inc.</name>
8   </author>
9   <id>urn:uuid:60a76c80-d399-11d9-b93C-0003939e0af6</id>
10  <opensearch:totalResults>4230000</opensearch:totalResults>
11  <opensearch:startIndex>21</opensearch:startIndex>
12  <opensearch:itemsPerPage>10</opensearch:itemsPerPage>
13  <opensearch:Query role="request" searchTerms="New York History" />
14  ...
15  <link rel="search" type="application/opensearchdescription+xml"
16    href="http://example.com/opensearchdescription.xml"/>
17  <entry>
18    <title>New York History</title>
19    ...
20  </entry>
21 </feed>
22
```

GData Protocol: Advanced Search Query

- OpenSearch does not specify syntax for search query

- It can be anything, free text
 - GData Protocol further allows for filtering and projection

- Filtering

- Fine-grained conditions based on values of various elements
→ such as **author**, **category**, **max-results**, **min** and **max** of **published** and **updated** elements.

```
1 http://www.example.com/feeds/jo?q=Darcy&updated-min=2005-04-19T15:30:00:
2 http://www.example.com/feeds?category=Fritz%7CLaurie // URL encoded OR
3 http://www.example.com/feeds?category=Fritz,CLaurie // AND
```

- Partial Response (~Projection)

- Which elements of an entry should appear in the search result
 - A language based on XPath syntax (subset of a valid XPath expression)

```
1 http://example.org/blog/main?fields=link,entry(@qd:etaq,updated,link[@rel='ed
```

GData Protocol: Partial Update

- **PATCH HTTP Method**
 - IETF specification, see *PATCH Method for HTTP* [↗](#)
 - Add, modify or delete selected elements of an entry
 - **Examples**
 - To delete a description element and add a new title element
 - **gd:fields** uses partial response syntax
- ```
1 PATCH /myFeed/1/1/
2 Content-Type: application/xml
3
4 <entry xmlns='http://www.w3.org/2005/Atom'
5 xmlns:gd='http://schemas.google.com/g/2005'
6 gd:fields='description'>
7 <title>New title</title>
8 </entry>
```
- **Rules**
    - Fields not already present are added
    - Non-repeating fields already present are updated
    - Repeating fields already present are appended

## GData Protocol: Entity Tags

- **Resource Versioning**
    - Conditional GET and PUT (concurrency control)
      - See *Lecture 4 – scalability*
    - Etags on atom and entry elements
  - **Example**
- ```
1 GData-Version: 2.0
2 ETag: W"C0QBRXcycSp7ImA9WxRVFUK."
3 ...
4 <?xml version='1.0' encoding='utf-8'?>
5 <feed xmlns='http://www.w3.org/2005/Atom'
6   xmlns:gd='http://schemas.google.com/g/2005'
7   gd:etag='W"C0QBRXcycSp7ImA9WxRVFUK."'>
8   ...
9   <entry gd:etag='CUUEQX47eCp7ImA9WxRVEkQ.'">
10   ...
11   </entry>
12 </feed>
13
```
- It is possible to do a conditional GET/PUT on the entry by using the ETag **"CUUEQX47eCp7ImA9WxRVEkQ."**

GData Protocol: HTTP Methods Overriding

- Firewall restrictions
 - *Some firewall configurations do not allow to send HTTP request other than GET and POST*
- HTTP methods overriding through **POST**
 - X-HTTP-Method-Override: PUT
 - X-HTTP-Method-Override: DELETE
 - X-HTTP-Method-Override: PATCH
- Example
 - 1 | POST /myfeed/1/1/
 - 2 | X-HTTP-Method-Override: PATCH
 - 3 | Content-Type: application/xml
 - 4 | ...
